5

CLAIMS

- 1. An orthoalkylation catalyst for phenols, produced by calcining a catalyst precursor comprising basic magnesium carbonate (a) and magnesium oxide (b), wherein the basic magnesium carbonate (a) and the magnesium oxide (b) are mixed together at a weight ratio ((a)/(b)) of 20/80 to 80/20.
- The orthoalkylation catalyst for phenols as claimed in claim 1, wherein the basic magnesium carbonate
 (a) is heavy magnesium carbonate.
 - 3. The orthoalkylation catalyst for phenols as claimed in claim 1 or 2, wherein the magnesium oxide (b) is light burned magnesia.
- 4. The orthoalkylation catalyst for phenols as

 claimed in claim 1, wherein the catalyst precursor further

 comprises manganese oxalate (c) in an amount of 0.1 to 10%

 by weight based on the total (100% by weight) of basic

 magnesium carbonate (a) and magnesium oxide (b).
- 5. The orthoalkylation catalyst for phenols as

 20 claimed in claim 1, wherein the catalyst precursor is molded

 before calcination and the calcination is performed at 300

 to 500°C in the absence of molecular oxygen.
- 6. The orthoalkylation catalyst for phenols as claimed in any of claims 1 to 5, wherein the orthoalkylation catalyst has a catalytic surface area of 25 to 500 m^2/g .

7. A process for producing an orthoalkylated phenol, which comprises performing a vapor phase reaction of a phenol with an alkyl alcohol in the presence of the orthoalkylation catalyst claimed in any of claims 1 to 6 so that an orthoalkylated phenol is obtained.
